This is because the final IP address of the servers are tied to each other through the database.</p> <p>The archive server can be installed at any time as it is not directly part of the ViciDial cluster but an ancillary server. It is, however, more convenient to install it prior to the Dialers so that you can put in the information for it during the Dialer install. To set-up an archive server you simply need to install ViciBox Redux to phase 1 (OS Install), then just type 'archive-setup'. It will create</p>

a directory in /home/archive used by the archive user you create. This will be accessible from <http://server/archive/> in a web browser.

To do an offline install the server needs to NOT detect internet. This may include unplugging the server from the network during the phase-1 install. During the phase-2 install you will be asked if you want to do an online update or not.

So for a standard new system install (all-in-one, first box for most people):

Download the the ViciBox_Redux.i686-3.0.X.iso (replace X with latest version)
Download the the ViciBox_Redux.i686-3.0.X.md5 (replace X with latest version)
md5 check the .iso to be sure the download was clean (Microsoft provides a nice tool for this for free: MicrosoftFCIV)
Burn the .iso
Make sure internet is connected to server
Boot from the .iso
At prompt enter: root / vicidial to log in
"os-install" to begin OpenSUSE installation
Follow menu through to complete installation
(Enter new network parameters or accept DHCP settings, we should get a link to the OpenSUSE instructions for network/partitioning)
After OS first install, remove CD during reboot. System will then complete the installation after the reboot.
When OS installation complete, enter root / (YOUR Provided Password) to enter the fresh OpenSUSE OS.
"vicibox-install" to begin VICIdial installation.
Once again follow through the menu items. (And I guess a link to the standard instructions for installation of VICIdial at the end, including the final IP setting)

So, Kumba, to do the step 1, have I to prompt os-install and vicibox-db first?

The scenario is
- 1 Dialer
- 1 DB/WEB Server

So I suppose to prompt os-install and vicibox-db for the db/web server, and vicibox-install instead of vicibox-db for the dialer.

Am I wrong? (I think so 😊)

Greets from Italy.

the 'vicibox-db' is only available on the 64-bit database CD. If you are using the regular 32-bit ViciBox, then you just type 'vicibox-install' and enter 'Y' when it asks to install the database role. After that, when installing the Dialer, you would say 'N' to the Database role, and when the ViciDial installer asks for the database info towards the end, you would put in the IP for the Database Server.

The 64-bit DB-Only ViciBox does not have a vicibox-install script. Just as the 32-bit regular ViciBox does not have a vicibox-db script. Also, the archive-setup script only exists on the 32-bit regular ViciBox. This was all done intentionally to make sure that no one would use their database inadvertently as an archive server or dialer on larger clustered setups.

The install document for v3 Redux is up, and I am putting together the cluster addendum to that now.

Cluster addendum is up, and ViciBox v.3.0.3 is on it's way now because of it.

I just downloaded the 64 bit but it's telling me that there is no command found for vicibox-db. Help. Thanks.

1) post your system specs with every post
2) at what stage of what process are you experiencing this error (perhaps you could post what you are seeing and describe your situation?)
3) this post is old and not related to the download you may have just made, and it's about the release of an .iso, this is a support question. perhaps you could start your own thread?
